FRYINGPAN RIVER DIDYMO ANALYSIS (2015-Second Annual)

Executive Summary

As a follow up to research initiated in 2014, Colorado Mountain College Natural Resource Management program (CMC NRM) monitored the Fryingpan River for didymo presence three times during 2015. The first sampling event was in May prior to spring runoff and peak flows, the second was in July following peak flows, and the third was in October to represent baseflow conditions.

Didymo is a native, nuisance species in rivers and streams throughout Colorado. A fast growing diatom, didymo covers substrate and has the potential to alter historic macroinvertebrate habitat. Creating effective mechanisms to prevent the spread or introduction of invasive and nuisance species is important for maintaining the health of the Fryingpan River ecosystem and fishery. The continued education of anglers and river users is important to reducing the spread of didymo to other water bodies in the watershed and around the Colorado. Wader washing stations can help reduce the spread of didymo and the introduction of new non-native or nuisance species.

This study suggests that increased flushing flows at or above 700 cfs during the spring simulate natural snowmelt conditions and promote bedload migration and the removal of didymo from the substrate. Results indicate increased didymo at all reference sites compared to the 2014 data. Responsible management and consistent dialog between the Bureau of Reclamation, water managers, water stewards, and recreational businesses will assist with flow control for environmental and recreational purposes.

Continued monitoring of fish populations, benthic invertebrates, and water quality for nutrient concentrations throughout the Fryingpan could help describe the relationship of didymo in the aquatic ecosystem. An ongoing monitoring strategy is recommended for the Fryingpan River to include sampling of five key sites (Site 1, 8, 12, 15, and 20) three times annually, plus three reference sites upstream of Ruedi Reservoir (Appendix I). This sampling should be complimented with a comprehensive 5 year study at all sites.

Methodology

Sampling methodology in 2015 was the same methodology used in 2014 (see *Didymo Survey, Lower Fryingpan River, 2014*). 20 sites were sampled in 2014. In 2015 some sites were not sampled at each event because of restricted access.

Results

The following charts represent the total didymo biomass recorded (g/in^2) at each site visited and for each seasonal sampling event. Raw data is presented in Appendix II.

Figure 2. Colorado Mountain College field technicians scraping didymo from a rock to be analyzed in the lab

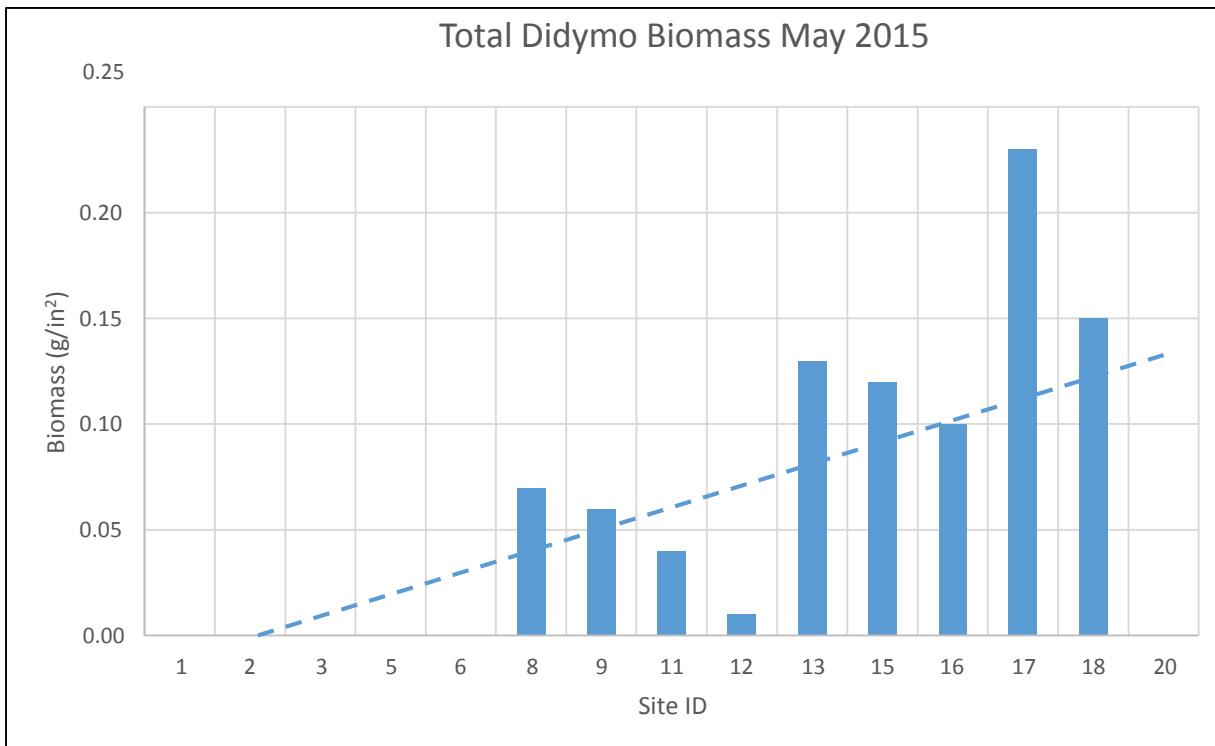

Figure 1. Summary of Didymo Biomass from May 2015 Sampling Event

* Note 2. The dotted line on the graphs for May and July represents the trend of didymo biomass from Site 1 to Site 20.

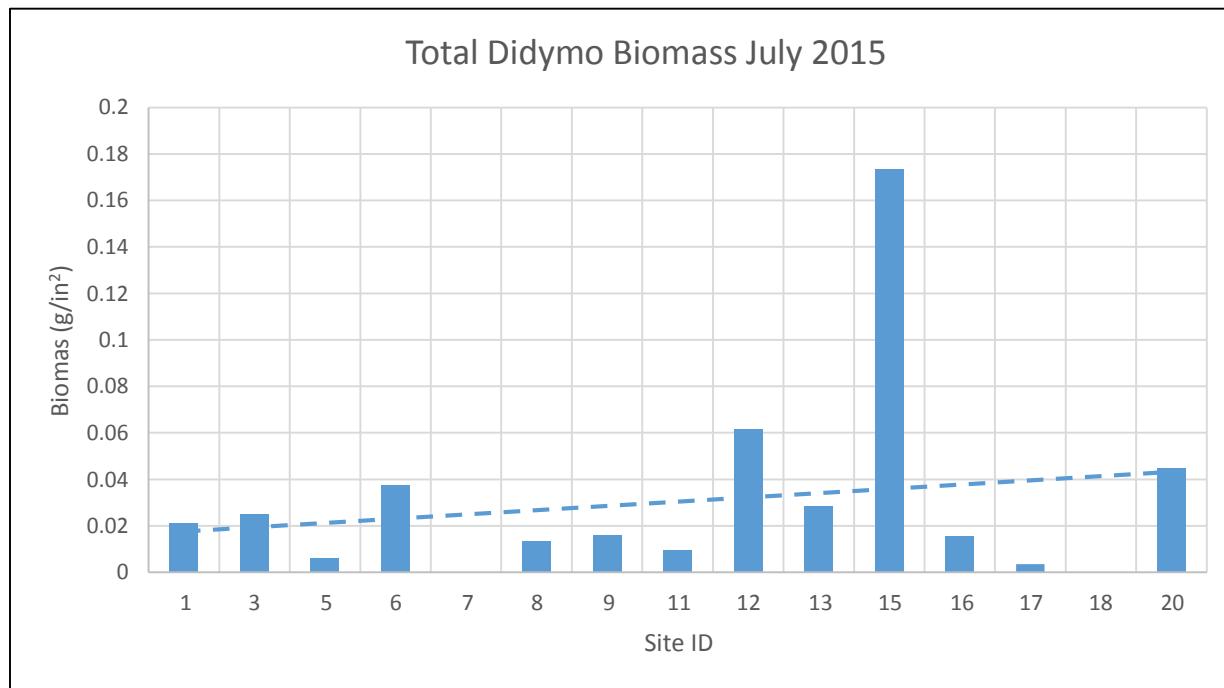

Figure 2. Summary of Didymo Biomass from July 2015 Sampling Event

*Note 2. The dotted line on the graphs for May and July represents the trend of Didymo biomass from Site 1 to Site 20.

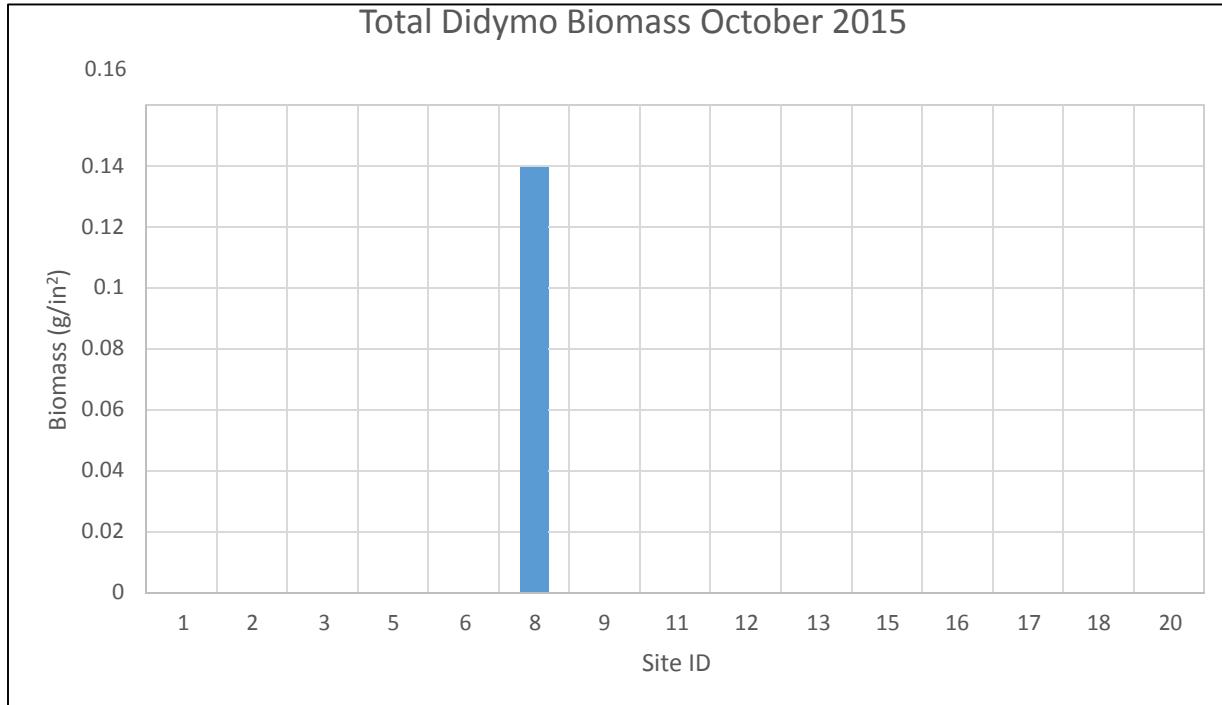

Figure 3. Summary of Didymo Biomass from October 2015 Sampling Event

Discussion of Results

The high flow of approximately 830 cfs on June 6th, 2015 had a noticeable effect on downstream sites closest to Basalt, but didn't reduce the presence of didymo at the more upstream sites. In 2014, peak flow was approximately 760 cfs and lasted 3 days, with flows maintained above 400 cfs for almost two weeks. In contrast, the 2015 hydrograph shows two distinct periods of higher flows. One peak was approximately 700 cfs on June 6th, 2015 and a second, more sustained peak lasted 4 days, beginning on June 18th. After these two flushing events the flow returned to 300 cfs or less for the remainder of the summer and fall.

The mass of didymo per unit area (g/in^2) was measured during the May, July and October 2015 sampling events, represented in Figures 1-3.

In May, didymo presence was concentrated near the tailwaters of Ruedi Reservoir and decreased downstream.

In July, didymo was distributed more equally throughout the sample sites, with the highest biomass found at Site 15. Didymo presence at the reference sites increased during the May and July 2015 sampling events compared to the same sampling times in 2014. The high flow event in 2014 was significantly higher in nearby gaged tributaries (USGS 09078475 and 09079450) compared to the high flow event in 2015.

In October, didymo presence of greater than 5% was observed only at Site 8. The biomass of didymo at Site 8 increased significantly from July to October, but decreased or remained the same for the rest of the sites. This phenomenon may warrant further investigation if similar trends are documented in the future.

Recommendations

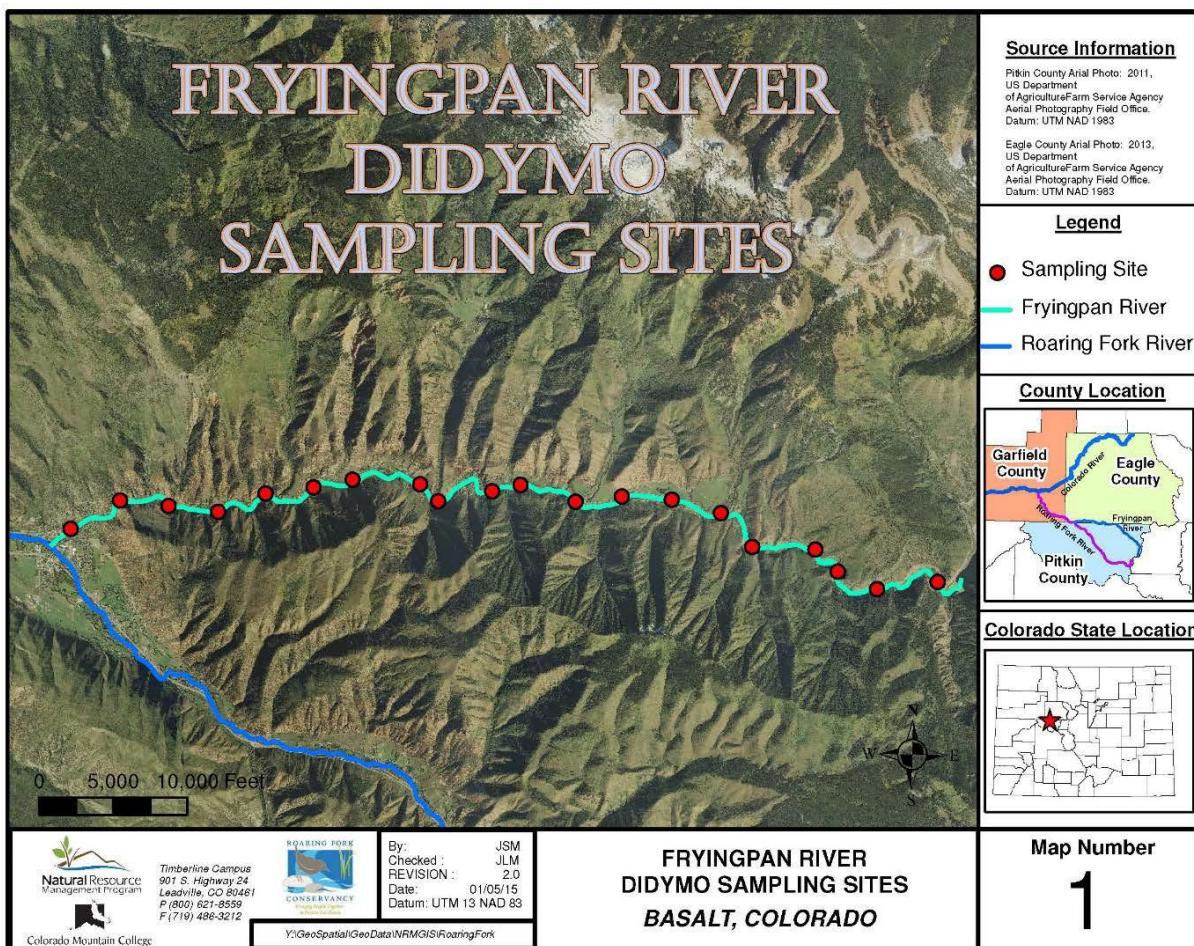

Creating effective mechanisms to prevent the spread or introduction of non-native and nuisance species is important for maintaining the health of the Fryingpan River ecosystem. The continued education of anglers and river users is important to reducing the spread of didymo to other water bodies in the watershed and around the State of Colorado. Wader washing stations can help reduce the spread of didymo and the introduction of new non-native or nuisance species.

This study suggests that increased flushing flows (at or above 700 cfs) for an extended period of time during the spring simulate natural snowmelt conditions and promote bedload migration and the removal of didymo from the substrate. Responsible management and consistent dialog between the U.S. Bureau of Reclamation, water managers, water stewards, recreational businesses and other stakeholders will promote appropriate flow control for environmental and recreational purposes.

Monitoring fish populations, benthic invertebrates, and water quality for nutrient concentrations throughout the Fryingpan could help reveal correlations between the relationship of didymo and the surrounding aquatic ecosystem.

An effective didymo monitoring protocol to detect changes in the ecosystem and document any new occurrences is crucial to understanding both presence and impacts of didymo. Recommended didymo monitoring for the Fryingpan River includes five key sites on the lower Fryingpan (Site 1, 8, 12, 15, and 20) and the three reference sites upstream of Ruedi Reservoir to be sampled three times annually: pre-high flow, post-high flows and late summer/fall (baseline flow)(Appendix I). This sampling regime should continue annually, supplemented with comprehensive 5 year studies at all sites. Sampling should follow the same protocol CMC NRM used, which can be found in the *Didymo Survey, Lower Fryingpan River, Basalt, Colorado 2014 Report*.

October Water Quality Data						
Site #	Date	Time	pH	Temp (SC (μ s/cm)	DO (mg/L)	Notes
Norrie*	10/27/2015	11:25	7.45	3	69.2	11.3 No sample taken
North Fork*	10/27/2015	11:35	7.54	3.4	38.4	11.64 No sample taken
Res Inlet*	10/27/2015	11:55	7.87	4	133.3	12.13 A lot of green & brown algae covering rocks
20	10/27/2015	12:25	8.62	9.9	176.2	12.22 Thick mats of green algae, more algae than didymo but didymo present
18	10/27/2015	12:45	8.4	9.5	186.1	10.27
17	10/27/2015	12:58	8.31	9.2	187.7	10.3
16	10/27/2015	13:12	8.4	9.2	186.8	10.41
15	10/27/2015	13:18	8.32	9.1	187.7	10.06 More didymo in areas with less moving water
13	10/27/2015	13:35	8.24	9	206.1	10.43
12	10/27/2015	13:42	8.28	8.5	198.2	10.52
11	10/27/2015	13:50	8.29	8.4	200.6	10.74
9	10/27/2015	14:00	8.4	8.1	209	10.89 No sample taken
8	10/27/2015	14:07	8.53	8.1	210.4	10.95
6	10/27/2015	14:31	8.47	8.1	218.4	10.84 Where there is moving water there is no didymo. Banks have ~50% but is covered in red silt
5	10/27/2015	14:42	8.43	7.9	225.1	10.94
3	10/27/2015	14:52	8.41	7.7	229.8	10.96
2	10/27/2015	15:00	8.37	7.6	230.7	10.97
1	10/27/2015	15:10	8.34	7.5	231.4	10.84 No sample taken
